

FINAL FIX — Logo Files + Missing Watermark + Polish (grounded in actual code)

I opened your real repo (`public/hr-portal.html`) and traced the exact bugs. This prompt is precise — no guessing.

What I found (context for the agent — verify this yourself first)

Your Offer Letter, LOR, LOC, and Star Performer templates are HTML/CSS generated (in `public/hr-portal.html` , functions building `html / w.document.write(...)` strings), not pdfkit. They already correctly reference two logo files:

```
/assets/TEN_logo_dark_transparent.png  
(used on white-background templates: Offer  
Letter, LOR, Star Performer)  
/assets/TEN_logo_gold_for_navy_bg.png  
(used on the navy-gradient LOC template)
```

Both files exist at `public/assets/` — **but their content is broken**: the transparency was flattened to

solid black at some point, so instead of showing the logo they render as a near-black square. That's what's showing as broken in the screenshots.

There's a second, separate bug: the CSS defines a `.watermark` class (a rotated, low-opacity background overlay) for the Offer Letter and LOR templates, but the actual `<div class="watermark">...</div>` element is never inserted into the HTML — so it silently does nothing on those two. Meanwhile LOC and Star Performer get a watermark automatically via a CSS `::after` pseudo-element containing the text "THE ENTREPRENEURSHIP NETWORK" rotated -35deg at ~4% opacity. That's why LOC looks slightly more finished — it's the only one where the watermark code actually fires, and even then it's spelled-out text, not the logo graphic.

Task 1 — Replace the two broken logo files (attached to this message)

Replace the existing files at these exact paths with the two PNGs attached to this message (same filenames, so no code changes needed for this step):

- `public/assets/TEN_logo_dark_transparent.png`
- `public/assets/TEN_logo_gold_for_navy_bg.png`

These new versions have the correct background color baked directly into each file (white for the first,

navy #1a1a2e for the second) instead of relying on transparency — this is deliberate, so there's no alpha channel left to accidentally lose again during any future save/transfer step.

Task 2 — Fix the missing watermark, and make it the logo graphic on all 4 templates

Replace the current watermark approach (spelled-out rotated text, only working on 2 of 4 templates) with the actual logo image used as a large, faint, centered background watermark — consistently on all 4: Offer Letter, LOR, LOC, and Star Performer.

Concretely:

- Add a watermark logo image (large, e.g. 60–70% of page width, centered on the page, `opacity: 0.04–0.06`, `pointer-events: none`, positioned behind the text content — same visual idea as the current `.watermark / ::after` rotated text, just swap the text for the logo image) to **all four** templates, not just LOC/Star Performer.
- Use the dark logo variant as the watermark on the white-background templates (Offer Letter, LOR, Star Performer) and the gold variant on the navy LOC template — same light/dark pairing rule as the header logo.

- You can keep a slight rotation (the existing -35deg look is fine) or center it upright — your call, keep it subtle either way.
- Remove or keep the existing text-based watermark CSS as you see fit, but the end result must be: every one of the 4 templates shows the actual logo graphic faintly in the background, not text, and not missing entirely.

Task 3 — General professional polish (light touch only)

- Match spacing, font sizing, and field-label styling patterns already used in whichever of the 4 templates looks most finished today — apply that same level of polish to the others so all 4 feel like one consistent family of documents.
- Double check the existing QR-code verification feature (`generateQRDataUrl` / the `qrDataUrl` block already present in the code for all 4 templates) is actually rendering a QR image next to "Scan to verify" and not silently failing — if it's broken, fix it; if it already works, leave it alone.
- Test every template with a deliberately long name and long college/university name to confirm nothing overflows.

What NOT to do

- Do not change the underlying document verification ID generation or the `/verify?id=...` URL logic — only visual/asset changes in this task.
- Do not change body-paragraph wording.
- Do not change the established per-template color scheme (navy/gold for LOC, gold/cream for the others) beyond what's needed to add the logo watermark.
- Do not touch any other part of the codebase.

Final checklist

- ☐ Both logo files replaced at the exact same paths; real logo now visible (not a black square) in the document header on all 4 templates.
- ☐ All 4 templates show the actual logo graphic as a faint background watermark — not text, not missing.
- ☐ QR verify feature confirmed working (or fixed) on all 4.
- ☐ Long name/college name tested on all 4 — nothing overflows.
- ☐ Verification ID logic, verify URL, body wording, and color scheme untouched.

- [] Nothing else in the codebase modified.

Push back to the same repo/branch when done and confirm which push method you used.
